

# How to use?

Please read the [walkthrough](#) and the [FAQ](#) before mailing me questions

If you have the CD or USB, all drivers are included.

If you use the floppy, you need one or more of the driver floppies, too.

## Overview

1. Get the machine to boot from the CD or USB drive.
2. Floppy version need to swap floppy to load drivers.
3. Load drivers (usually automatic, but possible to run manual select)
4. Disk select, tell which disk contains the Windows system. Optionally you will have to load drivers.
5. PATH select, where on the disk is the system?
6. File select, which parts of registry to load, based on what you want to do.
7. Password reset or other registry edit.
8. Write back to disk (you will be asked)

**DON'T PANIC!! - Most questions can usually be answered with the default answer which is given in [brackets]. Just press enter/return to accept the default answer.**

The walkthrough and instructions is now on its own page! but is quite old.. hope to make a new one..

## What can go wrong?

Well. Lots of things, actually. But most of the problems is of the type "cannot find" something. And then nothing happens.

Also, see the [FAQ](#) for help with common problems.

For Linux-knowledged people, you may do things manually if the scripts fail, you have shells on tty1-tty4 (ALT F1 - ALT F4).
